

MAINTENANCE GUIDE

Regular cleaning and maintenance of your new PVC floors will keep them looking beautiful and prolong the products service life.

Up keeping your floor

WOODEFFECTS LVT has various colors and pattern choices and a number of advantages such as outstanding durability and looks great to look at. It also has the features of easy application and maintenance, but regular cleaning and up-keeping is required to maintain the product correctly.

1. Daily Cleaning (Residential, Commercial)

- a) Dirt left on the floor can damage and tarnish the surface of the floor. So, please make sure to remove these immediately and clean on a regular basis.
- b) Use the recommended cleaning solution as instructed on the bottle to clean the PVC floor.
- c) When the mop is too wet, the binding part or edge of the floor tiles can expand or widen creating a gap due to moisture. We recommend the use of a really well rung mop. (Do not apply too much water to this floor)
- d) When there is a solvent material, paint, copy liquid or any other chemicals spilt on the surface, you should remove it with alcohol immediately. In case of using a strong solvent such as thinner or acetone, the contamination gets worse and it causes discoloration.
- e) Contamination by oils and fats should be cleaned with a neutral detergent.

2. Surface Protection Treatment (Commercial Product)

- a) The surface protection treatment for maintenance is not necessarily required, however it is recommended to be applied on a regular basis when the coating layer on the surface is used in high traffic area's with long-term use. This is in order to prevent further contamination. (see your retailer for the recommended suitable products that can be used)
- b) When processing surface protection treatment, you need to clean the dirt adhering to surface using a neutral detergent first, and apply a thin wax 2 to 3 times. Then, you will see a clean surface without any stain.

- c) Surface protection treatment varies depending on the operating conditions, but the treatment in the following table is recommended in general for commercial use.

Foot Traffic	Wet rag	Period of treatment	Notes
Heavy	Frequently	2-3 times/week	Department stores, offices, public office
Medium		2-3 times/month	Exhibition, general office
Light		once/6 months	Residential (living room, kitchen, study)

- d) Please select the appropriate products for surface protection (wax) according to use of the floor (Glossy, Matt, Wood, PVC).

3. Other Considerations (Residential, Commercial)

- Installation of mats at the entrance of the building is recommended to prevent inflow of sand and dust adhering to shoes.
- It is necessary to block the sunlight with curtains as discoloration and shrinkage on the place exposed to the direct sunlight can occur.
- PVC floors can be tarnished by rubber mounted under the bridge of furniture, sofa's and home appliances, so please use it with protective materials (tin foil, paper) so that it does not directly touch the PVC floors.
- When moving heavy furniture such as pianos, it must be moved with care so that the floor is not pushed back or stabbed by sharp edges.
- It is necessary to prevent defects due to moisture with a silicon finish between the wall and threshold near kitchen sink and toilet doorway.
